The NeoCosmos way of thinking is born from logic, reason, and common sense, starting from what we can observe and reflect upon. Free from inherited ideologies and narratives, each book offers a direct and easy-to-read vision. It does not seek to convince, only to provide clarity so the reader can think for themselves.

DARWIN

THE FINITUDE OF BIOLOGICAL DESIGN

Culture assumes evolution is an infinite, upward trajectory.

Humanity imagines itself as a midpoint toward a future genetic perfection.

This book dismantles that idea. It proposes that evolution is finite, driven by efficiency—not morality or aesthetics.

Once a species reaches **Evolutionary Harmony**—where further mutation

costs more than it benefits—structural change stops.

The biosphere is not a draft in progress; it is the final outcome of a chaotic cycle that has already closed.

Sample – Chapter 1: THE END OF EVOLUTION

Human culture rests on a single idea: evolution is an endless path. It is presented to us as an ongoing process, a force pushing all forms of life toward a future of constant change and improvement—a belief that stems from a fundamental error. We are not in the middle of the process. We are at the end of it.

What we see today is not evolution in action, but its final result. The life that walks, breathes, or thinks on Earth is the product of a cycle of millions of years of chaos, chance, mutations, and extinctions that has already concluded its creative phase. The great experiment of biological transformation is over. There will be no new structural leaps, no radically different forms of life emerging, and no higher intelligence appearing through natural means.

To understand this, it is necessary to introduce a key concept: evolutionary harmony. This is the state a species reaches when it no longer needs to change, because its form and functions are optimal for its existence. It has reached such a complete point of balance that any significant

mutation would cease to be an improvement and instead become a disadvantage. It already possesses everything necessary to survive, reproduce, and interact with its environment efficiently. Once this threshold is crossed, natural evolution—understood as a driving force for profound change—loses its purpose.

Index of Chapters (9)

THE END OF EVOLUTION

Argument about the closure of the evolutionary process and functional harmony.

THE TWO PHASES OF LIFE:

ADAPTATION AND HARMONY

Examination of adaptive evolution as the initial stage and harmonic as the final.

THE BIOLOGICAL CEILING OF INTELLIGENCE

How body form limits higher mental capacity development.

THE FALLACY OF EVOLUTION IN WAVES

Critique of punctuated equilibrium versus continuous change.

HARMONY IS NOT STAGNATION

Dismantling the belief that stability equals failure.

THE EXTINCTION OF ENTIRE SPECIES

Why evolutionary harmony does not guarantee immortality.

THE SYSTEM'S DISCARD: FAILED EXPERIMENTS

Dinosaurs and other species as evolutionary discards.

THE MOST INTELLIGENTLY VIABLE SURVIVES

How survival depends on intelligence-driven adaptation.

THE CLOSURE OF THE PLANETARY EVOLUTIONARY CYCLE

Argument about the end of evolution as a collective phenomenon.

The table below is one of
the 10 to 15 included in the
complete book, offering
additional perspectives to
view the topics from other
angles.

CRITERIA THAT DEFINE THE BIOLOGICAL CEILING OF INTELLIGENCE

Criterion	Influence on Intelligence Limit	Example Impact on Species
Brain volume and skull size	Restricts processing capacity	Fish cannot match primate cognition
Sensory organ design	Limits quality and type of data input	Dolphin intelligence is auditory-based
Limbs and manipulation	Defines interaction capabilities	Primates create tools, dolphins cannot
Energy efficiency	Prevents "excess" unused intelligence	No species evolves capabilities it cannot apply

ADAPTATION AS A FUNCTION OF INTELLIGENCE

Adaptation Step	Cognitive Process Required	Example Species and Response
Perception	Detect environmental change	Bird senses early winter and adjusts migration path
Evaluation	Interpret meaning of change	Predator shifts hunting ground
Decision	Select optimal course of action	Human chooses to irrigate during drought
Execution	Carry out chosen response	Beaver builds dam
